Hiring Team, Artificial Intelligence
Doctolib

Application: Machine Learning Engineer Intern (x/f/m), Paris

Dear Hiring Team,

I am applying for the Machine Learning Research Intern role in Doctolib's AI team. I want to do applied research where the result reaches care teams and patients, and your work on optimising care pathways across Europe is a concrete version of that. I am a Master's student in Machine Learning at UCL, fluent in English and French, and Python is my main language.

At the Max Planck Institute for Human Development I led a self-directed research project on conversational mode collapse in LLMs. I built an 8,504-example dataset from 10,000 self-conversations, labelled by a 31B LLM judge with 95% of labels validated, and fully fine-tuned Qwen2.5-3B over five versions on an HPC cluster using PyTorch, SLURM and vLLM. The model detects its own collapse in unseen conversations, and I reported honestly that recovery was only temporary.

I also build models end to end outside research. My image-captioning project pairs a pre-trained ResNet-50 encoder with a custom Transformer decoder using cross-attention, evaluated with multi-reference BLEU. At To Ai I shipped LLM agents to production, so I am used to taking an experiment through to something that runs reliably.

I graduate in September 2027 and, as a French citizen, can work in France without sponsorship. I would like to discuss how the April 2027 start fits with my MSc schedule. Thank you for your time; I would be glad to talk about the team's projects.

Kind regards,

Fares Shretah
